

PONGO

ODOUR NEUTRALISER AND MASKING AGENT

- Highly concentrated and easy to handle
- Neutralises and eliminates both simple and complex odours
- Scientifically formulated to react with a wide spectrum of organic and inorganic odour
- For both internal and external applications
- High neutralising efficiency resulting in lower chemical consumption
- Delivers a pleasant natural masking scent whilst neutralising odours
- Diluted solution applied using a fine water spray misting system such as air assisted atomising sprays, high pressure fogging systems and fog cannons
- Effective, efficient and permanent
- Non-toxic, environmentally friendly and biodegradable
- Non-sensitising, non-volatile, non-flammable and non-corrosive
- 100% water soluble

APPLICATION

Dilute and mix Pongo directly into the water to be mist sprayed as an odour neutralising solution.

Pongo performs at dosage rates of up to 1:30,000 but this is subject to the site conditions. The solution can be made stronger if the odour being treated is very overwhelming.

EXPECTED RESULTS

A pleasant 'natural' masking smell is delivered whilst the active molecules in Pongo go to work neutralising and permanently eliminating the odorous residue in the air.

DESCRIPTION

Pongo has two modes of action - masking and neutralising.

Pongo provides instant masking of the odour where a 'naturally' pleasant smell is introduced in high enough concentrations to mask the unpleasant smell. The nose then only detects the pleasant smell that gives rise to a fresh smell. The masking of the bad smell does not neutralise the odour.

Pongo's second mode of action is 'odour neutralisation'. This is a process that nullifies the odour-producing chemical, including those persistently produced. During this process, the atomised Pongo molecules absorb the odour-producing compound, neutralising the compound. The result is not just the elimination of the unpleasant smell, but a light and fresh aroma to the location.
